MAINTAINING THE ENDEM RELATIONSHIP BETWEEN CULTURE AND EDUCATION: TOWARDS A DECENTRALIZATION OF NIGERIAN EDUCATION POLICY

Abstract
Nigerian education system is run with little or no respect for the desired relationship between culture and education. With its preference for an over centralization of education policy, cultural elements of each regional or ethnic multiplicity are made to suffer on the altar of one-indissolubility. This makes it easy to relegate indigenous languages to an optional grade in the policy. It equally makes it easy to underplay some indigenous cultural elements to the advantage of foreign values and mores. This paper contends that any education system which adopts a centralized policy makes deep cultural values far away from the people. A decentralization of education policy instead, paves a way for the maintenance of the usual relationship between culture and education.

Keywords: Culture, Education, Decentralization, Education Policy and Language.

Introduction
The relationship between education and culture is an established fact. Culture, on one hand, represents the summation of everything a society has accumulated over a period of existence. Everything, here, includes knowledge, belief, art, law, custom and all other capabilities acquired by man as a member of a society. Nkom’s definition is encapsulating. According to him, culture is;

the dynamic outcome of a society’s struggle to harness and tap the resources of its environment for its material welfare and of its continuing attempt to fashion out an acceptable way of organizing its material reproduction and regulating or harmonizing the relationship between individuals and groups in the society and between that society and other societies (Nkom, 1982:232)

In other words, Culture is that aspect of our existence which makes us similar to some people, yet different from the majority of the people in the world. It is the way of life common to a group of people, a collection of beliefs and attitudes, shared understandings and patterns of behaviour that allow those people to live together in relative harmony, but set them apart from other peoples (Friedell and Pflieger, 1977). With the foregoing we can see that culture interprets human surroundings and give them improved meaning which allows us express ourselves, language, religion, science, and art, notion of right and wrong explanation of the meaning of life – these are all parts of the cultural systems of a society.

The foregoing is in agreement with one of the sociological school of thoughts-“The Functionals” they believe that culture benefits the whole of society. They believe that if everyone in society shares the same beliefs and ideas, i.e. a value consensus is reached, and then society as a whole can be kept in a civilized manner. They also believe that socialization is a key factor to shaping culture and society. What can be deduced from the summary of all the definitions is that cultures are in a constant process of change as individuals and societies adapt to new circumstances. In view of this therefore, it means culture is for the continuity of the society; and as such, every society has a pattern of behaviour, which distinguishes them from others. One could say that cultures evolve much as living beings do. We could therefore submit that a culture of a society is the identified totality of the way of life of that particular society and whenever this is compromised then the identity is lost.

Culture in Education and Education in Culture
Studies have showing the potency of Culture and the education on the overall development of the child and human society. Thus, Culture and Education are inseparable, as they are simply two sides of the same coin. The two concepts can in fact be said to be indistinguishable, as the primary definition of Education is Acculturation. The indistinguishable features of Culture and Education explain the fact that every human society- whatever its level of technical evolution- devotes considerable attention to transmitting its cultural heritage to the young. This trans-generational transmission of culture has helped to cement human solidarity and to ensure the continued survival of societies over the ages. Before the emergence of schools as specialized agencies, Education took place in society, where the young and the not so young became educated by simply living their culture (Obanya, 2005)

One can now find sense in the argument that a society’s culture is the expression of a specific historical situation and of a distinctive, irreducible view of the world, of life and death, of man’s significance, of the tasks he has to discharge, his prerogatives and limitations, and of what he has to do and what he may hope for. All these functions are, however, passed down to man from one generation to the other through the instrumentality of education. Education, in this case, serves the function of preservation and transmission of cultural modes from one generation to the other. It is what Ottaway (1962) refers to as a conservative function. This means that the task of education is to retain and hand over cultural values, norms, goals and behavioral patterns of the society to the young ones and subsequently, to posterity. Obanya confirms this opinion when he asserts that;

every human society devotes a considerable amount of time and energy to transmitting its cultural heritage to its younger generation. It is this inter-generational transmission of cultural heritage that is the primary meaning and the primary function of education (Obanya, 2007:5)

Aside the cumulative function, education has another interesting function – the function of transformation of culture. This function appears antithetical to the first one, but indeed, it is not, it is rather complementary. As education ensures conservation, it also ensures that what is conserved is allowed to go through a process of change which is inevitable. This change is made possible through critical and inventive educated persons in the society, who are able to generate new discoveries that could bring about a new mode of life. This is why Elegbe believes that the major concern of education is;

Introduction

The relationship between education and culture is an established fact. Culture, on one hand, represents the sumation of everything a society has accumulated over a period of existence. Everything, here, includes knowledge, belief, art, law, custom and all other capabilities acquired by man as a member of a society. Nkom's definition is encapsulating. According to him, culture is:

the dynamic outcome of a society's struggle to harness and tap the resources of its environment for its material welfare and of its continuing attempt to fashion out an acceptable way of organizing its material reproduction and regulating or harmonizing the relationship between individuals and groups in the society and between that society and other societies (Nkom, 1982:232)

In other words, Culture is that aspect of our existence which makes us similar to some people different from the majority of the people in the world. It is the way of life common to a group of people living in close relation to each other, having a collection of beliefs and attitudes, shared understandings and patterns of behaviour that allow the people to live together in relative harmony, but set them apart from other peoples (Friedl and Pease, 1977). With the foregoing we can see that culture interprets human surroundings and give them inner meaning which allows us express ourselves, language, religion, science, and art, notion of right and wrong explanation of the meaning of life - these are all parts of the cultural systems of a society.

The foregoing is in agreement with one of the sociological school of thoughts: "The Functionalists" they believe that culture benefits the whole of society. They believe that if everyone in society shares the same beliefs and ideas, i.e. a value consensus is reached, and then society as a whole can be kept in a civilized manner. They also believe that socialization is a key factor, to shaping culture and society. What can be deduced from the summary of all the definitions is that cultures are in a constant process of change as individuals and societies adapt to new circumstances. In view of this therefore, it means culture is for the continuity of the society, and as such, every society has a pattern of behaviour, which distinguishes them from others. One could say that cultures evolve much as living beings do. We could therefore submit that a culture of a society is the identified totality of the way of life of that particular society and whenever this is compromised then the identity is lost.

Culture in Education and Education in Culture

Studies have showing the potency of Culture and the education on the overall development of the child and human society. Thus, Culture and Education are inseparable, as they are simply two sides of the same coin. The two concepts can in fact be said to be indistinguishable, as the primary definition of Education is Acculturation. The indistinguishable features of Culture and Education explain the fact that every human society - whatever its level of technical evolution - deserves considerable attention to transmitting its cultural heritage to the young. This trans-generational transmission of culture has helped to cement human solidarity and to ensure the continued survival of societies over the ages. Before the emergence of schools as specialized agencies, Education took place in society, where the young and the not so young became educated by simply living their culture (Obanya, 2005).

One can now find sense in the argument that a society's culture is the expression of a specific historical situation and of a distinctive, irredenct view of the world, of life and death, of man's significance, of the tasks he has to discharge, his prerogatives and limitations, and of what he has to do and what he may hope for. All these functions are, however, passed down to man from one generation to the other through the instrumentality of education. Education, in this case, serves the function of preservation and transmission of cultural modes from one generation to the other. It is what Ottaway (1962) refers to as a conservative function. This means that the task of education is to retain and hand over cultural values, norms, goals and behavioral patterns of the society to the young ones and subsequently, to posterity. Obanya confirms this opinion when he asserts that;

every human society devotes a considerable amount of time and energy to transmitting its cultural heritage to its younger generation. It is this inter-generational transmission of cultural heritage that is the primary meaning and the primary function of education (Obanya, 2007:5)

Aside the cumulative function, education has another interesting function – the function of transformation of culture. This function appears antithetical to the first one, but indeed, it is not, it is always to go through a process of change which is inevitable. This change is made possible through critical and inventive educated persons in the society, who are able to generate new discoveries that could bring about a new mode of life. This is why Elegbe believes that the major concern of education is;
to surround a child with all the influences which society may judge to be healthy for body and soul, while at the same time training the understanding to become, when it is ripe, the critic and judge of those influences (Elege, 1972: 169-170)

Hence, education helps the society in conserving and transforming its values and beliefs. Again, reversibly, one could ask this question: of what particular benefit is culture to education? One may answer by saying that culture is the basis for education. Akinpelu rightly notes that;

No educational system can exist in vacuum; it must exist in context, that is, it must fit neatly into other preferences, values and priorities of the society for which it is being designed. The type of society envisaged is a good guide to the type of educational philosophy to be expected (Akinpelu, 2005:152).

In another work, he reinstates the connection as follows;

A genuine system of education when critically studied and analyzed should yield some distinctive value-system which must be identical with that of the society to describe that educational system as relevant (Akinpelu, 2005:159)

The point being made here is that education derives its existence and meaningfulness from a socio-cultural ideology. It is an activity which goes on in a society, and its aims and methods depend on the nature of the society in which it takes place. This is implied in Cokey’s keynote address at the conference organized by NERC (Nigerian Educational Research Centre) for national curriculum review, that “it is the society which sets the goals which education follows”(Cokey in Adaralegbe, 1969). The inevitable inference one could make from this is that the type of society and the kind of persons envisaged in a society determines the kind of education to come on board. This is exactly what Bertrand Russell means when he says that we should have some programme conception of the kind of person we would like to produce before we can have definite opinion as to the education which we consider suitable (Stephenson, 2001).

**Education and Socio-Cultural Ideologies**

To further illustrate the interaction between education and cultural background, a quick consideration is made of how education systems have gained their point of departure from socio-cultural ideologies is imperative. We may begin with ancient civilization in Greece. In the Greek world, the Spartans were given the task of giving the original inhabitants of the territory which they had required, they needed to continuously fight wars and maintain victory over their assailants. Thus, the Spartan society was essentially militaristic. Athenians, on the other hand, were neighbors of the Spartans, but their ideology contrasted the latter. Their ideology was to prepare for war but more importantly, make peace with the neighboring cities, and permanent enmity against their neighbors. Athens opened up and diplomatically absorbed many other smaller city-states, teemed them up with herself and floated a confederacy. It was a system designed to develop the citizens in the cultivation of the intellect. To achieve this, Adenokun (2006) notes that the Athenians subscribed to all-round development of man – mentally, physically, socially, culturally and morally. The curriculum consisted of reading, writing, poetry, mathematics, physical training and education, gymnastics, etcetera.

Again, in the ancient Roman world, education was at the beck and call of cultural ideology. The Roman society focused on agriculture as the mainstay of her economy, and on war, needed to protect the territorial integrity of the empire. It thus followed that the traditional Roman education was inextricably woven around agriculture and war. In modern times, examples abound in:

- Union of Soviet Socialist Republic, now commonly referred to as Russia. The ideology adopted is socialism; and the system of education reflects this ideology.
- The United States adopts capitalism and pragmatism as her socio-cultural and economic character. The education system, albeit not entirely the same across the states, is largely pragmatic and capitalistic.
- There is another example in Tanzania. President Julius Nyerere, in Arusha Declaration, configured a “National Ethic” which was a blueprint of the socialist and communalistic society that Tanzania was to be. This blueprint was immediately followed-up with an educational philosophy captioned: “Education for Self-Reliance”.

One could go on and on, and cite examples of societies that evolved cultural ideologies for themselves, and immediately coupled such ideologies with complementary educational philosophies and systems which would help to achieve such ideologies. What this translates into is that no nation produces an educational philosophy and system, unless it has first identified the kind of society and the kind of people she wants in the society. This submission is what Fafunwa has in mind when he pontificates thus;

*Before we can discuss intelligently the type of educational structure, organization and administration suited to a renaissance Nigeria, we must first and foremost ask the most important philosophical question in educational planning: What kind of Nigerian society do we plan for? – A socialist, capitalist, fascist, Islamic, Christian, animist? (Fafunwa, 1967:22)*

The foregoing discussions obviously reflect a symbiosis: culture needs education and vice versa. Perhaps, this is why Obanya (2007) considers culture and education as inseparable, as they are two sides of the same coin. The two concepts are, in his opinion, indistinguishable as the primary definition of education is accommodation. In these interactions, however, culture occupies a more important seat for there cannot be anything called education if there is no culture in the first instance. Education as pointed out by Ottaway, is an activity which goes on in a culture, and its aims and methods are dependent on the culture of the society in which it takes place (Ottaway, 1962). This means that the culture of a people informs the type of education predisposed to her young ones. Now, if “every type of society has its own underlying
dimension," (Nkom, 239) and it is true that "education depends on the total way of life of a society" (Ottaway, 1962), then, the kind of education provided will be different in different cultures. Although kinds of culture/society. This is what comparative education has brought to limelight. Although human beings are essentially the same in all spheres, they however constitute some differences in their values, aspirations, belief-system, occupations, languages, dressing and all other categories of life in turn preserved and transformed with the kind of education adopted, which is the result of education. It is quite people the society wishes to evolve. One is aware that the system of education in Ghana is quite different from French; different from Britain; even in the same country like U.S.A where there are different levels of education. These differences are incidentally caused by locations in the globe, that make up a way of life. These differences are sacrificed on the altar of unity. In the bid to unite Nigeria into 'one indissoluble country', following the aflennath civil war (1967-1970), the policy-makers, under the instruction of the then Head of State, Gen. Yakubu Gowon, sought to use education to heal the wounds. Although this move was laudable, it was however the beginning of re-education of the Nigerian child. The policy-makers cared less about the peculiarities and idiosyncrasies that make up the entity Lugard forcefully brought about. They became oblivious of the fact that even in our similarities, there exist lots of disparities. The way of life of the Yoruba man is, unarguably, different from the Hausa. A policy which does not take this into cognizance is naturally bound to fail. No wonder. Nkom had considered Nigeria as a classic example of a country where systematic planning of the culture components of the development process have been absent.

Decentralization of Nigerian Education Policy

The failure to appreciate that culture is the reason for education, and that wherever there are diversities of culture, there ought to be diversities of education policies and systems, is one of the key reasons for educational inefficiency in this country. For education to achieve its optimum results, Nigeria, a decentralization of the national policy is inevitable. Decentralization, here, does not negate our unity, it as a matter of fact, strengthens unity. It co-importantly, ensures that people manipulate the resources in their immediate environment to their benefits, and the larger societal benefit. Obanya understands this position clearly when he says that a responsive national policy on education should accord both voice and visibility to needs at sub-national levels. He says,

"In the Nigerian context, a responsive national educational policy would mean 36-37 policies equal one policy." In practical and concrete terms, each state of the Nigerian federation would require a state-specific policy. The overall national policy can then take the form of a general policy framework, while the state policies will contain the bulk of the specifics. The policy development sequence should be one in which state-level policy dialogues feed into national realities. The process will also help in broadening the scope of participation in policy development" (Obanya, 2007: 209)

Obanya's submission has revealed so much. It needs only be said that the only policy that ever worked since the introduction of western education in Nigeria, was that of the regionalization era in the 1950s. With Awolowo and Awokoya in the West, Azikwe and Akpabio in the East and some efforts in the North, a lot of landmarks were recorded. Education became close to the people; people's needs were directly felt and response to education became an instrument for exploration and exploitation of people's immediate environment, it meant adaptability and suitability to the community where one lived in; and more importantly, education became a tool for self-discovery, propagation and transformation of communal ethos. Yet in all these, the unity of the country was not circumvented. Practices in the west were emulated in the east, in the north, and so, there was a healthy competition and not rivalry which pervades the present scenario. This healthy competition would have continued but for the break introduced by Gowon's administration.

The point made so far is that the inability of our national policy to respect the relationship between culture and education constitutes a mismatch in the system. A reverse of this situation is possible if we can meaningfully identify diversities in our unity. A decentralization of the national policy will do this. This is the practice adopted in all countries with heterogeneous cultures. It is the system in United States, Spain, Brazil, New Zealand, Mexico, India, Argentina, Chile, Venezuela, even Burkina Faso, Ethiopia, Austria, Colombia and many other countries where homogeneity is far-away. It is a practice with promises of educational improvement: administrative efficiency; financial efficiency; development of local-contexts; effects on equity (Fisk, 1996).

A related deficiency which demands attention in the policy is the position given to indigenous languages (mother tongues). Language occupies an important aspect of any culture. It is a non-material aspect of culture. It is a part of culture that cannot be toyed or tampered with. A little distortion generates a confused-identity. So important it is that Ojulari (2009) affirms unrepentantly that when there is "no language, no education". Thus, a culture-oriented education policy would include culture-related directives such as "languages of instruction, and particularly commitment to the development of indigenous languages for use in education" (Obanya, 2007). Incidentally, the centrality of language to the teaching-learning process, the importance of Nigerian languages to the protection, preservation and promotion of Nigerian cultures and the enhancement of human dignity, and the necessity of learning a major language for purposes of promoting national unity and integration, all have constitutional backing in the 1999 constitution of the Federal Republic of Nigeria. Coincidentally, the government appreciates the importance of language as a means of promoting social interaction and national cohesion and preserving culture. Thus, every child shall learn the language of the immediate environment. Furthermore, it is the interest of national unity, expeditious and secure education in three Nigerian languages. Hausa, Igbo and English (2004: 5)

It is baffling, then, with the above realization, that the mere drive to languages in the policy is permiting coming behind mathematics, English and even French-speaking. Despite not using a major national language in the teaching-learning environment, the increasing number of Nigerians who are not literate in the language of the immediate environment, is still a major reason why it should be taken as one of the
...Qualitative education for all, he found out that "over-centralization and over-bureaucratization in the other critical shortcomings and deficiencies identified as militating factors against efforts at providing management and control of the education system with consequent inevitable inefficiency, frustration of initiative constitutes a great cog in the wheel of educational progress", The decentralization sequel to his research on the problems and future prospects of the Nigerian education system, AmoD difference in education systems, we recommend that urgent steps be taken towards respecting the cultural variabilism, {a culture differing from another culture} there must be corresponding education is based on the full integration of the individual into the community, Since it has been argued that education and culture are inseparable, and that wherever there are various cultural components in Nigerian education policy, Ojulari says; Education should not force the cultural values of the majority on the minority but rather moderate the values to be taught in small societies on acceptable and rational model. Our education should be shaped on different communal needs and values; it is then education could be of great relevance to us all (Ojulari, 2010: 13).

If indeed justice is to be done to the statement made on page four of the policy, that efforts shall be made to relate education to each community needs, then each culture or region would be allowed to develop its own strategy to respond to its peculiarities and idiosyncrasies. We argue that a decentralization of the policy is inevitable. Akinpelu (2005) argues that there is a "grave need for extensive decentralization in the nation’s educational system so as to allow for local adaptations and experimentations". His agreement is sequel to his research on the problems and future prospects of the Nigerian education system. Among other critical shortcomings and deficiencies identified as militating factors against efforts at providing qualitative education for all, he found out that "over-centralization and over-bureaucratization in the management and control of the education system with consequent inevitable inefficiency, frustration and shifting of initiative constitutes a great cog in the wheel of educational progress". The decentralization of education, proposed in this work, will ensure that each cultural variation in Nigeria is well taken care of. Education will no longer be alien to those who receive it.

Along with decentralization, is the idea of catering for indigenous languages in the country, after all, language is an essential aspect of culture. The relegation given to indigenous languages in the languages in the present policy must be revised. Native languages are used in America, England, children explore their natural endowment and environment, and thus, acquire at very early adaptability necessary for further growth in later stages of development (Olamposu, 2000). Why is mother tongue on intellectual growth. Hence, Nigerian languages should no longer be taken as given to English and French, and they are used all through the process of education. Decentralizing education makes this process much easier. It is gainful to conclude with the following words from Obanya; Promoting education-in-culture and culture-in-education will help in addressing the issue of relevance, which has eluded education reforms in post-colonial Africa. It will also lead to a desirable paradigm shift that returns education to its original meaning of acculturation, thereby contributing to rediscovering the education that Africa lost with colonization (Obanya, 2007: 53).

Conclusion
Since it has been argued that education and culture are inseparable, and that wherever there is cultural variabilism, {a culture differing from another culture} there must be corresponding difference in education systems, we recommend that urgent steps be taken towards respecting the various cultural components in Nigerian education policy. Ojulari says; Education should not force the cultural values of the majority on the minority but rather moderate the values to be taught in small societies on acceptable and rational model. Our education should be shaped on different communal needs and values; it is then education could be of great relevance to us all (Ojulari, 2010: 13).
