Assessment of Factors Affecting Maintenance Management of Public Hospital Buildings in Lagos State, Nigeria

O. A. Adenuga Ph.D
Department of Building,
Faculty of Environmental Science, University of Lagos, Nigeria.

Abstract
The study focused on factors affecting maintenance management of public hospital buildings in Lagos state. It also assessed the operational state of public hospital buildings within the study area. In achieving these objectives, opinions of maintenance officers and users of selected public hospital buildings were sampled through structured questionnaires. The data collected were analyzed using descriptive and inferential statistics. The analysis revealed the operational state of public hospital buildings in Lagos State as been average, and there is no significant difference in the perception of the maintenance staff and the users as to the operational state. Maintenance officers and users of the buildings both ranked insufficiency of fund for maintenance programme as second most significant factor among other factors responsible for poor maintenance management of our public hospital buildings. Other factors found to be highly significant by the maintenance officers are; attitude of users and misuse of facilities, lack of discernible maintenance culture, inadequate training and reluctance of some establishment to support innovations. The users on their own perspective, ranked the inflation of cost of maintenance by the operatives, use of poor quality components and materials by the maintenance department and without long-term arrangements for the supply of essential parts for replacement as the most significant factor affecting maintenance management respectively. The study recommended proactive measures to reduce the occurrence of defects in the buildings elements and services. Governments are to provide adequate funding for the running of public hospitals and it should be a government policy that every hospital either public or private must have maintenance policy guiding the implementation of their maintenance programme. Building elements should be regularly inspected to ensure their functionality.

Keywords: Hospital Building, Maintenance, Maintenance Management, Sick Building Syndrome, and Building Performance.

Introduction
Maintenance management in the public sector in Nigeria has suffered from lack of funds for a considerable time. While the requirements for good practice in maintenance management of building stock have been established over a considerable period, the achievement of good practice is by no means universal (Turrell, 1997). Maintenance of the built environment impacts on the whole nation. The conditions of the surroundings in which we live and learn, is a reflection of the nation's well being. (Lee, 1987). Maintainability of building has been identified as one of the key areas in which the construction industry must achieve significant improvement (Nayantharas de Silva et al, 2004).
According to Iyangba and Adenuga (2003) it is impossible to produce buildings which are maintenance free, but maintenance work can be minimized by good design and proper workmanship carried out by skilled experts or competent craftsmen using suitable codes of installation, requisite building materials and methods. Management of any process involves assessing performance, and maintenance management of buildings is no exception (Turrell, 1997). In order for any maintenance manager to measure performance and set priorities, the organizational needs have to be considered i.e. the function and performance of buildings and their appropriate standards will be independent on the user's perception and their primary needs (Chanter and Swallow, 1996). Performance of hospital buildings and their component depends to a large extent on continuous and planned periodical maintenance, which challenges owners and facility managers to institute precise planning based on a well-structured maintenance programmes (Shohet et al, 2002). Despite the ever-growing need for lower operational costs, facilities managers must ensure that facilities are constructed and maintained without compromising safety. In Nigeria, colonial architecture in some of the older public buildings especially hospitals which was hitherto famous for its sturdiness and functionality has now becomes less attractive because of the general neglect of the buildings. Overcrowding has also led to the deterioration of the facilities installed (Onifade 2003). If no action is taken all these old buildings and facilities will decay and will only be replaced in function if the means are available. The inadequacy of the operation and

maintenance of building and infrastructure in developing countries has serious consequences for economic and social development especially on the health sector.

**Statement of the problem**
Existing health sectors building in Nigeria lack adequate maintenance attention. Most public hospital buildings are in very poor and deplorable conditions of structural and decorative disrepair. While considerable of research have been carried out on factors responsible for the poor maintenance of public housing estates and offices in Nigeria but only scant attention has been given to the key parameters affecting the implementation of maintenance programmes for public hospital buildings. There is therefore a need to establish and evaluate the factor affecting maintenance management of public hospital buildings using appropriate analysis.

**Aim**
To find out the factors affecting maintenance management in public hospital buildings in Lagos state with a view of providing solutions to them.

**Objectives**
1. To assess the operational state (physical-functional condition) of public hospital buildings in Lagos state as carried out by the maintenance department.

2. To determine factors affecting maintenance management of public hospital buildings in Lagos state.
Research hypotheses

- There is no significant difference in the perception of maintenance staff and users on the operational state of public hospital buildings in Lagos state.
- There is no significant association between the maintenance staff and users in response to factors responsible for poor maintenance management of public hospital buildings in Lagos state.

An Overview

The Maintenance of Public Hospital Buildings

Today's government-operated public hospital is confronted by unique challenges that threaten its very existence (Stolzenberg, 2004). The characteristics and the structure of the public hospital, by their nature lack the capacity to compete in a market-driven economy. This deficiency is further found to originate in the institutions inherent government structure. This structure promotes inefficiencies and inflexibility, the imposition of bureaucratic impediments to operational effectiveness.

According to Shoheh (2003), the performance of hospital buildings and their components depends to a large degree on continuous and planned periodical maintenance.

Historically, in both public and the private sectors, maintenance is seen as an unavoidable task which is perceived as adding little to the quality of the working environment, and expending scarce resources which would be better utilized (Higher Education Backlog Maintenance Review, 1998). In Nigeria, according to Iyagba and Adenuga (2005), public buildings are in poor and deplorable conditions of structural and decorative disrepairs. In spite of millions of Naira spent to erect all these buildings, they are left as soon as commissioned to face premature but steady and rapid deterioration, decay and dilapidation.

The Built environment expresses in physical form the complex, social and economic factors, which give structure and life to a community (Lee, 1995).

According to Banful (2004) the financial consequences of neglecting maintenance is often not only seen in terms of reduced asset life and premature replacement but also in increased operating cost and waste of related and natural and financial resources. Maintenance is related to the background of any project, unfortunately development plans and approved recurrent and capital estimates in public hospitals in Nigeria have revealed that thought have not been given to maintenance work (Onifade, 2003).

Methodology

This research covers public hospital buildings in Lagos State, Nigeria.

From the comprehensive list of public hospitals, a selection of ten (10) public hospitals was done using the random sampling method. The simple random sampling method was chosen so as to give equal chances to all the listed hospitals. Two categories of questionnaires were designed for this study and were directed to the maintenance staff. Assessment of Factors Affecting Maintenance Management of Public Hospitals in Lagos, State Nigeria and the users of these selected public hospital buildings respectively.

Hence, a total of sixteen (16) questionnaires were sent out to each of the ten selected public hospitals, out of which eight of the questionnaires were directed to the maintenance staff and...
eight questionnaires were directed to the users of each of the ten public hospital buildings respectively. Thus a total of one hundred and sixty (160) questionnaires were sent out to the ten selected public hospitals of which a total of a hundred (100) questionnaires were completed and used for the analysis.

**Method of data analysis**
The data collected was analyzed using statistical package for social sciences (SPSS) so as to obtain a comprehensive and accurate analysis in both the descriptive statistics and inferential statistics as applicable.

**Analysis of data**
Below are the analysis and the results of data collected from the field survey as extracted from the data collection instruments (Questionnaires A and B respectively).

Source: Field Survey 2006

Operational state of building elements and services as perceived by maintenance staff and the users of public hospital buildings in Lagos State, using the scale; (1) Very bad (2) Bad (3) Average (4) Good (5) Very good

From the analysis, the following results were obtained:

The mean operational state of the structural elements (beams, columns, upper floor slabs and stairs) was found to be 3.47 hence; the operational state of the structural elements as perceived by both the maintenance staff and the users of public hospital buildings in Lagos State is average. The mean operational state of the walls (external and internal walls) was found to be 3.57 hence; the operational state of the walls as perceived by both the maintenance staffs and the users of public hospital buildings in Lagos State is good.

The mean operational state of the finishes (wall finishes, floor finishes and ceilings) was found to be 3.40 hence; the operational state of the finishes as perceived by both the maintenance staffs and the users of public hospital buildings in Lagos State is average.

The mean operational state of the roofs was found to be 3.35 hence; the operational state of the roofs as perceived by both the maintenance staffs and the users of public hospital buildings in Lagos State is average. The mean operational state of the services (sanitary appliances, building service equipment, disposal installation, water, heating and ventilation, electrical, gas, lifts, protection installation, drainages, external services) was found to be 3.54
the operational state of the
as perceived by both the
ance staff and users of
hospital buildings in Lagos State.
The mean operational state of
ing and furniture was found to be
the operational state of the
and furniture as perceived by
ance staff and the users of public
buildings in Lagos State is
average. The mean
state of sanitation of the
ment was found to be 4.16 hence,
rational state of sanitation of the
ment as perceived by both the
ance staff and the users of public
buildings in Lagos State is
Table 13).

the analysis, the maintenance staff
the users both agreed that
iciency of fund for maintenance
r is a dominant factor among
actors responsible for poor
ance management of public
buildings. The maintenance
ted the attitude of users and
al of facilities as the most
factor responsible for poor
ance management of public
buildings. On the contrary, the
ated inflation of cost of
ance by the operatives and the
poor quality materials by the
ance department as the most
factor responsible for poor
ance management of public
buildings.

Research hypotheses
There is no significant difference in
ception of the maintenance staff
users as to the operational state
hospital buildings in Lagos

II. = There is significant difference in
the perception of the maintenance staff
and users as to the operational state
public hospital buildings in Lagos
State.

From the computation for hypothesis I
the significance value for the t test was
found to be 0.06.

Decision: since 0.06>0.05 H₀ (null
hypothesis) is accepted.

Test of hypothesis 2
H₀ = There is no significant association
between the maintenance staff and
users in response to factors responsible
for poor maintenance management of
public hospital buildings in Lagos State.

H¹ = There is significant association
between the maintenance staff and
users in response to factors responsible
for poor maintenance management of
public hospital buildings in Lagos State.

From the computation for hypothesis 2,
the significance value for the t test was
found to be 0.08.

Decision: since 0.08>0.05 H₁ is rejected.
Hence, II. (alternative hypothesis) is
accepted.

Conclusion
The study has revealed that the
operational state (physical-functional
condition) of public hospital buildings
in Lagos State as carried out by the
maintenance department was found to
be average, the mean is 3.48. The
analysis discloses that the public
hospital buildings in Lagos State are in a
mere state of existence in terms of the
physical and functional conditions of
the building elements and services that
constitute these hospitals. For better
performance, a proactive rather than

A reactive approach should be adopted for effective maintenance practices.

As for the factors responsible for poor maintenance management of public hospital buildings in Lagos State, quite a number of hypothesized factors were identified with the degree of the significance of each of these factors established as presented in the body of research work. Although, the two groups of respondents, the maintenance staff and the users respectively, did not agree on the degree of the significance of most of the hypothesized factors except for insufficiency of fund for maintenance works, which the two
groups in their responses ranked to be the second most significant factor responsible for poor maintenance management of public hospital buildings in Lagos State. Lack of skilled personnel in the maintenance departments was also ranked as the median factor by both groups.

Although the study reveals that there is no significant difference in the perception of the maintenance staff and the users as to the operational state of public hospital buildings but there is no significant association between them in relation to factors responsible for poor maintenance management of public hospital buildings in Lagos State. The users, in their opinion attributed the cause to the maintenance department when the cost of maintenance is been inflated by the operatives, using poor materials and therefore producing a lower quality work. The maintenance staff held to their views that the users' attitude and misuse of those facilities by them is strongly responsible for poor maintenance management of public hospital buildings.

**Recommendation**

Public hospital buildings are places of healing as such more has to be done by both the maintenance management staff and the users to improve the operation state (physical-functional condition) above the average state as revealed by this research.

Maintenance managers and their team should adopt a proactive approach to reduce the occurrence of defects, which will consequently bring about better physical and functional public hospital buildings elements and services.

Government should provide adequate fund for the running of public hospitals and private individuals and organizations should endeavors to assist government health related issues. Government should equally make it as a matter of policy for private and public hospitals that there should be a maintenance policy guiding their maintenance programmes. Maintenance managers should equally give the narrow managerial span of control in use as this may likely bring about a more effective organizational structure leading to better maintenance management of public hospital buildings. It is also important that maintenance management work together with top administration management so as to secure sufficient funds for maintenance works as well as ensure that such funds is judiciously utilized.

Finally, maintenance management of public hospital buildings should ensure that the listed hypothesized factors are kept under check, as this will assist them in planning and executing maintenance programmes, as well as overcome the prevailing maintenance problems of public hospital buildings.
